Run the application

Settings

Prerequisites

You need to have Jena Fuseki Database named *SemWebProject* with persistent data. If you don't have fuseki, you can download it here : https://jena.apache.org/download/index.cgi
You also need a JDK8 if you run the application from an IDE. We advise you to use Netbeans like we did.

Prepare the database

Start the Fuseki server and import the turtle files from the folder *turtleFiles* in the package *resources*. You can use the web interface on the URL *localhost:3030* to configure the database.

Run the app

Be sure the *fuseki-server.bat* is running.
According to the IDE, start the application. You can now access it at the URL *localhost:8081*.
When you want access to the stations for a city, the data is automatically updated.
